

Mathematical supplement to
A minimal local covariant action for holographic dark energy:
constraints, perturbations, and nonlinear dynamics

1 Mathematical catalogue

1.1 Scope and indexing

This standalone mathematical supplement accompanies the main article [1]. References explicitly identified as belonging to the main article, including Appendices A–E, use its section and equation numbers. All other section and equation numbers refer to this supplement.

Subsections 1.2–1.5 and 1.7, together with the kinematics and normalizations given below, apply to the radiation-like branch $U = 0$ in the absence of an independent matter sector. The independent parameters used are the ratio of the magnitudes of the comoving momenta $r = k'/k > 0$, the cosine of the angle between them $-1 < z < 1$, and the variable $x = k\eta$. Subsection 1.6 contains a separate local result for a general potential $U \in C^6$ at $\chi < 0$ and $\Delta_\Phi \neq 0$. The condition $U = 0$ and the kinematics of the radiation-like branch do not apply to that subsection. The catalogue does not give the general gravitational amplitude on an arbitrary background. The tabulated coefficients do not include the external frequency factors, the overall scale, or the separate volume normalization of exactly homogeneous lines. These factors are retained in the formulas of the main article.

The position indices 0, 1, 2, 3 coincide with those in Subsection C.3 of the main article. In its main text, the description of the channel 13|24 preceding Eq. (195) labels the same positions 1, 2, 3, 4. The field indices 0, 1, 2 denote the scalar and the first and second linear tensor polarizations. The inward-directed momenta in units of k are

$$\begin{aligned} \mathbf{p}_0 &= (0, 0, 1), & \mathbf{p}_1 &= (0, 0, -1), \\ \mathbf{p}_2 &= (-r\sqrt{1-z^2}, 0, -rz), & \mathbf{p}_3 &= (r\sqrt{1-z^2}, 0, rz). \end{aligned} \quad (1)$$

The signed frequencies are $(c_{A_0}, c_{A_1}, -rc_{A_2}, -rc_{A_3})$, where $c_0 = 1/\sqrt{3}$, $c_1 = c_2 = 1$. For each external momentum $\mathbf{p}$, set $\mathbf{n} = \mathbf{p}/|\mathbf{p}|$. We use the vectors $\mathbf{e} = (0, 1, 0)$, $\mathbf{b} = (-n_z, 0, n_x)$ and the tensors $E_1 = \mathbf{e}\mathbf{e} - \mathbf{b}\mathbf{b}$, $E_2 = \mathbf{e}\mathbf{b} + \mathbf{b}\mathbf{e}$. Both tensors have squared norm two. The parameter t_θ of the original algebraic calculation is related to z by $t_\theta^2 = (1-z)/(1+z)$.

For an internal momentum $\mathbf{p}$ of nonzero norm, we use the unnormalized vector $\mathbf{b} = (-p_z, 0, p_x)$: $E_1 = \mathbf{e}\mathbf{e} - \mathbf{b}\mathbf{b}/p^2$, $E_2 = \mathbf{e}\mathbf{b} + \mathbf{b}\mathbf{e}$. The squared norms of the scalar and the two tensors are 1, 2, $2p^2$. Reversing $\mathbf{p}$ to $-\mathbf{p}$ between the ends of the internal line gives the factors $\tau_I = (1, 1, -1)$.

At $\mathbf{p} = 0$, we use five symmetric trace-free matrices. The two diagonal matrices are $\text{diag}(1, -1, 0)$ and $\text{diag}(1, 1, -2)$. The other three have unit entries at the pairs of positions xy, yx , xz, zx , and yz, zy , respectively. Their squared norms are 2, 6, 2, 2, 2. The kinetic sign of the homogeneous scalar coordinate is -1 . The covariances of the geometric coordinates are divided by the positive squared geometric norm. The kinetic sign of the scalar coordinate is accounted for in the free equation of motion without introducing a negative state probability.

1.2 Thirteen representative contact components and reconstruction of 81 components

For each contact component, four sets of coefficients of powers of x are given below: h_p for the full Hamiltonian contact term; b_p for the original Lagrangian contact term taken with the opposite sign; u_p for the sum of contact terms from eliminating auxiliary variables; and v_p for the sum of Legendre-transform contact terms. In all cases,

$$\frac{H_4}{g_R^2 k^4} = \sum_{p=-4}^0 h_p x^p, \quad h_p = b_p + u_p + v_p. \quad (2)$$

The individual partitions needed for the angular reconstruction are specified in Subsection 1.5.2. The sums u_p, v_p alone do not determine them. Coefficients of powers not listed are zero. The symbols R_s in the following formulas denote the explicit algebraic functions in Subsection 1.7, not external electronic records. When expressed in terms of z , some sources for the global Cartesian tensors contain $\sqrt{1-z^2}$; after changing to t_θ , all functions are rational.

Let T exchange the incoming and outgoing pairs, and let S exchange the two positions within one pair. The exact rules are

$$h_p^{BACD}(r, z) = h_p^{ABDC}(r, z) = h_p^{ABCD}(r, -z), \quad h_p^{CDAB}(r, z) = r^{4+p} \overline{h_p^{ABCD}(1/r, z)}. \quad (3)$$

The indices within each pair are ordered first, and the pairs are then ordered lexicographically. An odd number of within-pair exchanges gives $z \mapsto -z$. Exchanging the pairs corresponds to the substitution $r \mapsto 1/r$, complex conjugation, and multiplication by r^{4+p} . These identities have been checked separately for each of the 81 components. The same identities also hold separately for b_p, u_p, v_p defined in (2). The starting point is the total Lagrangian density $\mathcal{L}_\psi + \mathcal{L}_g$ on the radiation-like background, given in Eqs. (342)–(343) of the main article. Substituting the solutions of the linear constraints into its quadrilinear part gives b_p with the opposite sign. Eliminating the auxiliary variables at second order in the perturbations gives u_p , and the Legendre transform in Eq. (191) of the main article gives v_p . The corresponding decomposition of the full contact term is given in Eq. (351) of the main article.

In the quadrilinear coefficients of these parts of the contact term, all external-wave data are permuted: field types, momenta, signed frequencies, and polarizations. For u_p and v_p , each partition is first transformed according to (504), including the replacement $+\leftrightarrow -$ when the two positions within one external pair are exchanged. The three partitions $0, +, -$ are then summed according to (498). The resulting sums satisfy (3). For a fixed partition label, the rules (504) must be used. The original part b_p requires no such summation.

Components containing an odd number of fields with the second linear tensor polarization vanish identically by reflection symmetry under $y \mapsto -y$. There are 40 such components; the remaining 41 are reconstructed from 13 representatives.

1.2.1 Component 0000

$$\begin{aligned} h_{-4}^{0000} &= R_1 \\ h_{-3}^{0000} &= R_2 \\ h_{-2}^{0000} &= R_3 \\ h_{-1}^{0000} &= R_4 \\ h_0^{0000} &= R_5 \end{aligned} \quad (4)$$

$$\begin{aligned} b_{-4}^{0000} &= R_6 \\ b_{-3}^{0000} &= R_7 \\ b_{-2}^{0000} &= R_8 \\ b_{-1}^{0000} &= R_9 \\ b_0^{0000} &= R_{10} \end{aligned} \quad (5)$$

$$\begin{aligned} u_{-4}^{0000} &= R_{11} \\ u_{-3}^{0000} &= R_{12} \\ u_{-2}^{0000} &= R_{13} \\ u_{-1}^{0000} &= R_{14} \\ u_0^{0000} &= R_{15} \end{aligned} \quad (6)$$

$$\begin{aligned} v_{-4}^{0000} &= R_{16} \\ v_{-3}^{0000} &= R_{17} \\ v_{-2}^{0000} &= R_{18} \\ v_{-1}^{0000} &= R_{19} \\ v_0^{0000} &= R_{20} \end{aligned} \quad (7)$$

1.2.2 Component 0001

$$\begin{aligned}
h_{-4}^{0001} &= R_{21} \\
h_{-3}^{0001} &= R_{22} \\
h_{-2}^{0001} &= R_{23} \\
h_{-1}^{0001} &= R_{24}
\end{aligned} \tag{8}$$

$$\begin{aligned}
b_{-4}^{0001} &= R_{25} \\
b_{-3}^{0001} &= R_{26} \\
b_{-2}^{0001} &= R_{27} \\
b_{-1}^{0001} &= R_{28}
\end{aligned} \tag{9}$$

$$\begin{aligned}
u_{-4}^{0001} &= R_{29} \\
u_{-3}^{0001} &= R_{30} \\
u_{-2}^{0001} &= R_{31} \\
u_{-1}^{0001} &= R_{32}
\end{aligned} \tag{10}$$

$$\begin{aligned}
v_{-4}^{0001} &= R_{33} \\
v_{-3}^{0001} &= R_{34} \\
v_{-2}^{0001} &= R_{35} \\
v_{-1}^{0001} &= R_{36}
\end{aligned} \tag{11}$$

1.2.3 Component 0011

$$\begin{aligned}
h_{-4}^{0011} &= R_{37} \\
h_{-3}^{0011} &= R_{38} \\
h_{-2}^{0011} &= R_{39} \\
h_{-1}^{0011} &= R_{40}
\end{aligned} \tag{12}$$

$$\begin{aligned}
b_{-4}^{0011} &= R_{41} \\
b_{-3}^{0011} &= R_{42} \\
b_{-2}^{0011} &= R_{43}
\end{aligned} \tag{13}$$

$$\begin{aligned}
u_{-4}^{0011} &= R_{44} \\
u_{-3}^{0011} &= R_{45} \\
u_{-2}^{0011} &= R_{46} \\
u_{-1}^{0011} &= R_{47}
\end{aligned} \tag{14}$$

$$\begin{aligned}
v_{-4}^{0011} &= R_{48} \\
v_{-3}^{0011} &= R_{49} \\
v_{-2}^{0011} &= R_{50} \\
v_{-1}^{0011} &= R_{51}
\end{aligned} \tag{15}$$

1.2.4 Component 0022

$$\begin{aligned}
h_{-4}^{0022} &= R_{52} \\
h_{-3}^{0022} &= R_{53} \\
h_{-2}^{0022} &= R_{54}
\end{aligned} \tag{16}$$

$$\begin{aligned}
b_{-4}^{0022} &= R_{55} \\
b_{-3}^{0022} &= R_{56} \\
b_{-2}^{0022} &= R_{57}
\end{aligned} \tag{17}$$

$$\begin{aligned}
u_{-4}^{0022} &= R_{58} \\
u_{-3}^{0022} &= R_{59} \\
u_{-2}^{0022} &= R_{60} \\
u_{-1}^{0022} &= R_{51}
\end{aligned} \tag{18}$$

$$\begin{aligned}
v_{-4}^{0022} &= R_{61} \\
v_{-3}^{0022} &= R_{62} \\
v_{-2}^{0022} &= R_{63} \\
v_{-1}^{0022} &= R_{64}
\end{aligned} \tag{19}$$

1.2.5 Component 0101

$$\begin{aligned}
h_{-4}^{0101} &= R_{65} \\
h_{-3}^{0101} &= R_{66} \\
h_{-2}^{0101} &= R_{67} \\
h_{-1}^{0101} &= R_{68}
\end{aligned} \tag{20}$$

$$\begin{aligned}

1.3 Coefficients of the internal field and its x -derivative for all 54 pairs

In the heading $ij : ab$, the first two indices denote the momentum positions, and the second two denote the types of the two external fields. The coefficients are defined by

$$\frac{[L_3]_{ij,I}}{g_R k^3} = e^{-i\Omega_{ij}x} [A_{ij,I}(x)X_I + B_{ij,I}(x)\partial_x X_I], \quad A_{ij,I} = \sum_{p=-3}^0 A_{ij,I,p}x^p, \quad B_{ij,I} = \sum_{p=-2}^0 B_{ij,I,p}x^p. \quad (56)$$

The overall factor $g_R k^3$ has been factored out in accordance with the normalization in the article. The derivative ∂_x is taken with respect to $x = k\eta$. The spatial momentum of the trial internal line is $-(\mathbf{p}_i + \mathbf{p}_j)$, but its polarization basis is constructed from $\mathbf{p}_i + \mathbf{p}_j$. The index $I = 0, 1, 2$ refers to a line with nonzero momentum; for the pairs 01 and 23, the index $I = 0, 1, \dots, 5$ refers to six homogeneous directions. All coefficients not listed are zero.

1.3.1 Pair 01:00

$$A^{0100;0} = 0. \quad (57)$$

$$A^{0100;1} = 0. \quad (58)$$

1.4 Twenty-four time-ordered exchange entries

For each set of external fields, the table below specifies all entries, including those with zero coefficients.

Partition	Later pair	Earlier pair	Internal indices
02 13	02	13	0, 1, 2
02 13	13	02	0, 1, 2
03 12	03	12	0, 1, 2
03 12	12	03	0, 1, 2
01 23	01	23	0, 1, 2, 3, 4, 5
01 23	23	01	0, 1, 2, 3, 4, 5

For a line with nonzero momentum, $\nu_I = c_I |\mathbf{p}_i + \mathbf{p}_j|$. The exchange coefficients at two times are obtained by expanding the product

$$\frac{\tau_I}{2\nu_I \mathcal{N}_I} [A_{a,I}(x) - i\nu_I B_{a,I}(x)] [A_{b,I}(y) + i\nu_I B_{b,I}(y)]. \quad (489)$$

Each coefficient of $x^p y^s$ is multiplied by $-D_{ps}(\Omega_a + \nu_I, \Omega_b - \nu_I)$. The corresponding row of the table is used for the reverse time ordering.

For a homogeneous coordinate, set $X_a = A_a$, $Y_a = \sigma_I [(x - x_i)A_a + B_a]$. The covariance bilinear form (402) of the main article is used instead of (489). For the scalar, $\sigma_I = -1$, and there is no division by a negative norm; for the tensors, $\sigma_I = 1$, and division by 2, 6, 2, 2, 2 is retained. The physical covariances C_{QQ}, C_{PP}, C_{QP} are fixed before choosing k , whereas the dimensionless covariances transform as $C_{qq} = kC_{QQ}$, $C_{pp} = C_{PP}/k$, $C_{qp} = C_{QP}$. The additional volume factor and the two spatial delta functions are not included in A, B .

1.5 Finite angular reconstruction

The coefficients in Subsections 1.2–1.3 provide the starting data for the angular reconstruction. The individual contact partitions, boundary coefficients, and finite convolutions required to complete it are given below. The following finite procedure computes each coefficient without requiring data in machine-readable form. All operations are performed before taking the limit $r \rightarrow 1$.

For the partition $\varsigma = \pm 1$, substitute $z_\varsigma = (1 + r^2 - q^2)\varsigma/(2r)$. After cancellation of common factors in the rational expression, its denominator is a product of a power of q and a factor depending only on r . Multiplying out and collecting terms with equal powers of q therefore gives the finite series

$$A_{a,I,p}(r, z_\varsigma) = \sum_u a_{a,I,p,u}(r) q^u, \quad B_{a,I,p}(r, z_\varsigma) = \sum_u b_{a,I,p,u}(r) q^u. \quad (490)$$

The left-hand sides are given explicitly in terms of the functions R_s . Obtaining these series requires neither differentiating the action nor solving new constraints. The absence of a nonmonomial denominator in q is checked separately by the program that computes the angular coefficients.

Let $m = h_0 - h_1$, $n = h_2 - h_3$, $Z = (1 + r^2)/(2r)$, and

$$d_{mn}^j(\theta) = p_{jmn} W_{jmn}(z), \quad p_{jmn} = \sqrt{(j+m)!(j-m)!(j+n)!(j-n)!}. \quad (491)$$

For each admissible b , set $\alpha_b = j + (n - m)/2 - b$, $\beta_b = (m - n)/2 + b$. The finite set of coefficients w_{2d} of the polynomial $W_{jmn}(z_\varsigma) = \sum_d w_{2d} q^{2d}$ is given by

$$w_{2d} = \sum_b \frac{(-1)^{m-n+b}}{2^j (j+n-b)! b! (m-n+b)! (j-m-b)!} \times \sum_{u+v=d} \binom{\alpha_b}{u} \binom{\beta_b}{v} (1 + \varsigma Z)^{\alpha_b-u} (1 - \varsigma Z)^{\beta_b-v} \left(-\frac{\varsigma}{2r}\right)^u \left(\frac{\varsigma}{2r}\right)^v. \quad (492)$$

The outer sum is restricted by the nonnegativity of the factorial arguments, and the inner sum by the conditions $0 \leq u \leq \alpha_b$, $0 \leq v \leq \beta_b$. All coefficients w with odd indices are zero. Set $\mathcal{N}_I = n_I q^{d_I}$, where $(n_I, d_I) = (1, 0), (2, 0), (2, 2)$, and

$$v_{a,I,p,u}^\pm = a_{a,I,p,u} \mp i c_I b_{a,I,p,u-1}. \quad (493)$$

For each set of external fields, partition, and time ordering, the exact exchange coefficients in the linear polarization basis are given by the finite convolution

$$C_{ps\ell}^{a|b,I} = \frac{\tau_I}{2c_I n_I} \sum_{t+u+v=\ell+d_I} w_t v_{a,I,p,u}^+ v_{b,I,s,v}^- \quad (494)$$

The individual parts $h_p^{(d)}$ of the contact term are first reconstructed using Subsection 1.5.2. The corresponding momentum transfer is chosen for each crossed partition before adding the contributions of the two partitions. If $h_p^{(d)}(r, z_\zeta) = \sum_u h_{p,u}^{(d)} q^u$, then

$$H_{p\ell}^{(d)} = \sum_{t+u=\ell-1} w_t h_{p,u}^{(d)}. \quad (495)$$

The original contact term and the homogeneous part have no soft momentum-transfer denominator. They can be integrated with respect to z using the rule $\int_{-1}^1 z^v dz = 2/(v+1)$ for even v ; for odd v , the integral is zero. For homogeneous exchange, this rule applies to the products $A_a A_b$, $A_a B_b$, $B_a A_b$, $B_a B_b$ with the appropriate normalization. The fixed covariance bilinear form of Subsection 1.4 is then reconstructed using X, Y .

The transformation to helicities is performed by a finite sum over the four linear polarization indices with $C_{00} = 1$, $C_{h1} = 1/2$, $C_{h2} = i \operatorname{sgn}(h)/2$. Coefficients not listed are zero. The overall factors p_{jmn}/r , $2\pi/\sqrt{(1+\delta_{h_0 h_1})(1+\delta_{h_2 h_3})}$, the frequency factors in the normalization of the external one-particle states, and $g_R^2 k^3$ are restored according to the article. No additional tensor normalization is applied after this.

For the boundary contributions, set $V_a^\pm(x) = A_{a,I}(x) \mp i c_I q B_{a,I}(x)$ at $I = 0$. Their coefficients $V_{a,I,p}^\pm = A_{a,I,p} \mp i c_I q B_{a,I,p}$ have expansions in q with the coefficients given by (493). The same convolutions use $f_a V_b^-$, $V_a^+ f_b$, and $f_a f_b$. The nonzero coefficients f in the linear polarization basis at $\zeta = \zeta z$ are

$$\begin{aligned} f_{00} &= \frac{6ic_0 r(r-1)(1+\zeta)}{q^2}, & f_{11} &= \frac{6ir(r-1)(1+\zeta)(1+\zeta^2)}{q^2}, \\ f_{22} &= -\frac{12ir(r-1)\zeta(1+\zeta)}{q^2}, & f_{ab} &= 0 \quad (a \neq b). \end{aligned} \quad (496)$$

The coefficients of their finite series in q replace one or both coefficients v in (494) at $I = 0$. The coefficients are multiplied by exactly the time factors in Eqs. (390)–(391) of the main article. The factors x_i^{-1}, x_f^{-1} are not included in the coefficients a second time. The contributions from both time orderings are summed. The five boundary terms are given in Subsection C.6 of the main article, Eqs. (393)–(394). That subsection also shows the exact cancellation of the leading contribution proportional to q^{-3} when the boundary terms are combined with the bulk exchange.

The coefficients, individual contact partitions, and finite convolutions given here determine all bulk and boundary entries of the following table. Equation (492), the convolutions (494)–(495), and the boundary coefficients (496) define an analytical procedure for any integer $j \geq \max(|m|, |n|)$ allowed for the chosen external channels. If identical particles have equal helicities in the incoming or outgoing pair, j must be even, as stated after Eq. (369) of the main article. The four checked values $j = 0, 2, 3, 4$ determine only the contents of the following table, not the domain of applicability of this procedure.

1.5.1 Table of 74 bulk and 74 boundary entries

In the table, a is the incoming channel number and c is the outgoing channel number, with numbering starting from zero. The columns give the helicity values, so the external indices and the indices m, n of the Wigner polynomial are uniquely determined. Zero entries are retained.

1.5.2 Reconstruction of the individual contact partitions

The sums u_p and v_p in Subsection 1.2 do not determine the distribution of regular terms among the partitions. This distribution is specified explicitly below. The labels 0, +, - refer, respectively, to the partitions 01|23, 02|13, 03|12 and to the momentum transfers

$$q_0 = 0, \quad q_+^2 = 1 + r^2 - 2rz, \quad q_-^2 = 1 + r^2 + 2rz. \quad (497)$$

The coefficients decompose as

$$\begin{aligned} u_p &= u_p^{(0)} + u_p^{(+)} + u_p^{(-)}, & v_p &= v_p^{(0)} + v_p^{(+)} + v_p^{(-)}, \\ h_p &= b_p + u_p^{(0)} + u_p^{(+)} + u_p^{(-)} + v_p^{(0)} + v_p^{(+)} + v_p^{(-)}. \end{aligned} \quad (498)$$

The external indices $ABCD$ are omitted in these equalities. The seven terms in the second line are the individual parts of the contact term denoted by $h_p^{(d)}$ in (495) and in Eq. (378) of the main article.

Legendre-transform contact terms. For $a|b = 02|13$ or $03|12$, use the coefficients $B_{a,I,s}$ from Subsection 1.3, calculated with the internal momentum direction of the corresponding pair taken into account. Their finite convolution gives

$$v_p^{(a|b)} = \sum_{I=0}^2 \frac{\tau_I}{\mathcal{N}_I} \sum_{s+t=p} B_{a,I,s} B_{b,I,t}, \quad (\tau_I) = (1, 1, -1), \quad (\mathcal{N}_I) = (1, 2, 2q_{a|b}^2). \quad (499)$$

Here $q_{02|13} = q_+$, $q_{03|12} = q_-$. The homogeneous partition uses six coordinates and positive squared geometric norms:

$$\begin{aligned} v_p^{(0)} &= \sum_{I=0}^5 \frac{\sigma_I}{\mathcal{N}_I^{(0)}} \sum_{s+t=p} B_{01,I,s} B_{23,I,t}, \\ (\sigma_I) &= (-1, 1, 1, 1, 1, 1), \quad (\mathcal{N}_I^{(0)}) = (1, 2, 6, 2, 2, 2). \end{aligned} \quad (500)$$

In both convolutions, $s, t \in \{-2, -1, 0\}$; coefficients not listed are zero. The minus sign at $I = 0$ in (500) corresponds to the inverse kinetic coefficient of the homogeneous scalar coordinate. No additional factor of $1/2$ is introduced: the two cross terms of the quadratic correction arising from the Legendre transform have already been combined within each unordered partition. Nor is a second reversal of the polarizations at the other end of the internal line required, since it is already accounted for by the factor τ_I .

Homogeneous contact term from auxiliary-variable elimination. Define the dimensionless Laurent polynomials $\mathcal{J}_{01}^{AB}(x)$ and $\mathcal{J}_{23}^{CD}(x)$ by

$$\begin{aligned}\mathcal{J}_{01}^{00} &= -18x^{-2} - \frac{20\sqrt{3}i}{3}x^{-1} + \frac{4}{3}, \\ \mathcal{J}_{23}^{00} &= -18x^{-2} + \frac{20\sqrt{3}ir}{3}x^{-1} + \frac{4r^2}{3}, \\ \mathcal{J}_{01}^{11} &= -\mathcal{J}_{01}^{22} = -2x^{-2} - 4ix^{-1}, \\ \mathcal{J}_{23}^{11} &= -\mathcal{J}_{23}^{22} = -2x^{-2} + 4irx^{-1}.\end{aligned}\tag{501}$$

All polynomials with mixed external indices are zero. Denoting by $[x^p]$ the operation of extracting the coefficient of x^p , we obtain

$$u_p^{(0),ABCD} = 2[x^p](\mathcal{J}_{01}^{AB}(x)\mathcal{J}_{23}^{CD}(x)).\tag{502}$$

This finite rule determines the homogeneous part independently of the behavior of the nonzero-transfer contributions as $r \rightarrow 1$ and $z \rightarrow \pm 1$.

Contact terms from auxiliary-variable elimination in the crossed partitions. The 46 nonzero coefficients $u_p^{(+),ABCD}$ for the 13 representatives in Subsection 1.2 are given below. Coefficients of all other powers, including $p = 0$, are zero. The formulas retain the full rational functions, including the regular terms. For each representative, the coefficients of the second crossed partition are determined from the sum in Subsection 1.2:

$$u_p^{(-),ABCD} = u_p^{ABCD} - u_p^{(0),ABCD} - u_p^{(+),ABCD}.\tag{503}$$

Thus, the coefficients below, together with Eqs. (502) and (503), specify both crossed parts without repeating the auxiliary-variable elimination.

Permutations and the order of the angular reconstruction. For $w = u$ or $w = v$, permutations of the external indices also act on the partition label. Let $\iota(0) = 0$, $\iota(+)= -$, $\iota(-) = +$. Then

$$\begin{aligned}w_p^{(d),BACD}(r, z) &= w_p^{(d),ABDC}(r, z) = w_p^{(\iota(d)),ABCD}(r, -z), \\ w_p^{(d),CDAB}(r, z) &= r^{4+p} \overline{w_p^{(d),ABCD}(1/r, z)}.\end{aligned}\tag{504}$$

The table in Subsection 1.2.14 applies to the entire triple of partitions: an odd number of within-pair exchanges requires the simultaneous replacements $z \mapsto -z$ and $+ \leftrightarrow -$. Exchanging the incoming and outgoing pairs does not change the partition label. All 40 components containing an odd number of fields with the second linear tensor polarization are zero separately in each partition.

For the part labeled $+$, substitute $z = (1+r^2-q^2)/(2r)$ into (495); for the part labeled $-$, substitute $z = -(1+r^2-q^2)/(2r)$. The coefficients in q are extracted separately and only then summed. If the polynomial part is also separated out, division with remainder is performed in the variable q at fixed r : the numerator of the reduced fraction $u_p^{(\pm)}(r, z_\varsigma)$ or $v_p^{(\pm)}(r, z_\varsigma)$ is divided by its denominator after the stated substitution with the corresponding sign ς . As in (490), the denominator contains only a nonnegative integer power of q and a nonzero factor depending on r . The polynomial quotient therefore consists of terms with nonnegative powers of q , while the remainder divided by the denominator consists of terms with negative powers. This is equivalent to separating the finite Laurent series already obtained according to the sign of the power. The division is performed separately within each reconstructed function, and the polynomial quotient retains the same partition label. If the denominator is independent of q , the entire function belongs to the quotient. The sum of negative powers alone does not replace the full function: the regular part is neither discarded nor redistributed between $+$ and $-$.

The terms $u_p^{(0)}$ and $v_p^{(0)}$ are retained separately from b_p and from the regular parts at nonzero momentum transfer. Their volume normalization remains that of the isolated zero mode, specified by Eq. (403) of the main article. This normalization is not obtained by substituting $q = 0$ into the expression for a line with nonzero momentum. The absence of a soft momentum-transfer pole in a regular term does not by itself make that term an exactly homogeneous contribution.

Coefficients $u_p^{(+),0000}$.

$$u_{-4}^{(+),0000} = \frac{1}{q_+^4 r} \begin{bmatrix} -72z^3 + 10r + 10r^5 + 20r^3 + 24z \\ -264r^2z^3 - 264r^4z^3 - 104r^3z^2 \\ -72r^6z^3 + 24r^6z + 60rz^2 \\ +60r^5z^2 + 66r^4z + 66r^5z^4 \\ +72r^2z^5 + 72r^4z^5 + 80r^2z \\ +80r^4z + 132r^3z^4 \end{bmatrix} \quad (505)$$

$$u_{-3}^{(+),0000} = \frac{-4\sqrt{3}ir + 4\sqrt{3}i}{3q_+^4} \begin{bmatrix} 1 + r^4 - 9z^4 - 6z + 2r^2 + 18z^2 + 36z^3 \\ -42rz^4 - 42r^3z^4 - 36r^2z^4 \\ -26r^2z^2 - 18rz^2 - 18r^2z^5 \\ -18r^3z^2 - 12r^2z - 9r^4z^4 - 6rz^3 \\ -6r^4z - 6r^3z^3 + 8rz + 8r^3z \\ +18rz^5 + 18r^3z^5 + 18r^4z^2 \\ +36r^4z^3 + 90r^2z^3 \end{bmatrix} \quad (506)$$

$$u_{-2}^{(+),0000} = \frac{2rz}{3q_+^4} \begin{bmatrix} -8 - 36z^3 - 16r^2 - 8r^4 + 12r + 12r^3 \\ +24z^2 + 36z - 72r^2z^4 - 66rz^2 \\ -66r^3z^2 - 55rz - 55r^3z - 42r^2z^3 \\ -36r^4z^3 + 6r^2z + 9rz^3 + 9r^3z^3 \\ +24r^4z^2 + 36r^4z + 72rz^4 \\ +72r^3z^4 + 148r^2z^2 \end{bmatrix} \quad (507)$$

$$u_{-1}^{(+),0000} = -\frac{4\sqrt{3}ir^2z^2(r-1)(z+1)(3z-1)}{3q_+^2} \quad (508)$$

Coefficients $u_p^{(+),0001}$.

$$u_{-4}^{(+),0001} = \frac{2\sqrt{3}z^2 - 2\sqrt{3}}{q_+^4 r} \begin{bmatrix} -r - 6z - 6r^3 - 5r^5 - 26r^2z - 18r^6z \\ -12r^2z^3 - 9r^5z^2 - 2r^4z + 11rz^2 \\ +26r^3z^2 + 48r^4z^3 \end{bmatrix} \quad (509)$$

$$u_{-3}^{(+),0001} = \frac{-2iz^2 + 2i}{q_+^4} \begin{bmatrix} -r - 6z - 6z^2 - 4r^3 - 3r^5 + 8r^2 \\ +8r^4 + \sqrt{3}r^5 - \sqrt{3}r - 96r^3z^3 \\ -24r^2z - 12r^2z^3 - 10r^3z \\ -9r^5z^2 - 6\sqrt{3}z + 4r^2z^2 + 11rz^2 \\ +12rz^3 + 18r^4z^2 + 18r^4z^3 + 26rz \\ +30r^3z^2 + 36r^5z - \sqrt{3}rz^2 \\ -8\sqrt{3}r^4z - 4\sqrt{3}r^3z^2 \\ -3\sqrt{3}r^5z^2 + 4\sqrt{3}r^2z \\ +6\sqrt{3}r^4z^3 + 12\sqrt{3}r^2z^3 \end{bmatrix} \quad (510)$$

$$u_{-2}^{(+),0001} = \frac{2rz^2 - 2r}{3q_+^4} \begin{bmatrix} -18z^2 + 3r + 3r^2 + 3r^3 + 3r^4 + 18z \\ -39r^2z^2 - 36r^2z^3 - 18r^2z \\ -18r^4z^2 - 15r^3z - 9r^4z - 3\sqrt{3}r^2 \\ -3\sqrt{3}r^4 - 2\sqrt{3}z + 3\sqrt{3}r + 3rz^2 \\ +3\sqrt{3}r^3 + 6\sqrt{3}z^2 + 12rz + 36rz^3 \\ +36r^3z^2 + 36r^3z^3 - 48\sqrt{3}r^2z^3 \\ -27\sqrt{3}rz - 18\sqrt{3}r^4z^2 - 12\sqrt{3}rz^3 \\ -8\sqrt{3}r^2z + 3\sqrt{3}r^3z^2 + 21\sqrt{3}r^4z \\ +21\sqrt{3}r^2z^2 + 28\sqrt{3}rz^2 \\ +36\sqrt{3}r^3z^3 \end{bmatrix} \quad (511)$$

1.6 All 27 partial derivatives and five local vertices

This subsection applies to a general potential $U \in C^6$ on the regular local branch $\chi < 0$, $\Delta_\Phi \neq 0$, not only to the radiation-like background. The function $\mathcal{W}(\Phi, s)$ is obtained by algebraically eliminating L from the local density (162) of the main article. The equation for L is $sL + L^5 U'(L) + 4\Phi = 0$. Here $A_L = s + d(L^5 U')/dL = L^3 \Delta_\Phi$, $f_m = d^m(L^5 U')/dL^m$ for $m = 2, 3, 4, 5$, as in Eq. (417) of the main article.

We write $\mathcal{W}_{ab} = \partial_\Phi^a \partial_s^b \mathcal{W}$, where a, b are nonnegative integer indices, $1 \leq a + b \leq 6$. When differentiating with respect to one argument, the other is held fixed. After differentiation, all coefficients are evaluated on the background. In local inertial coordinates, set $\phi = \delta\Phi$, $s = \dot{\Phi} > 0$, $u = \dot{\phi}$, and $G_\phi = \delta^{ij} \partial_i \phi \partial_j \phi$. A dot denotes differentiation with respect to local time. The notation u and G_ϕ applies only to this subsection. The local densities $\mathcal{L}_n$ with $n = 2, \dots, 6$ contain all terms of the corresponding order in the perturbations and are defined by Eqs. (416) and (423) of the main article.

As a check, for $U = 0$ we have $f_m = 0$, $A_L = s$, and $\mathcal{W} = -s^4/(768\Phi^3)$. These local vertices do not replace the elimination of the gravitational constraints required to obtain the full fifth- and sixth-order action.

1.7 Explicit algebraic functions

The functions $R_s(r, z)$ given below determine the coefficients on the radiation-like background in Subsections 1.2–1.5. Their arguments satisfy the conditions $r > 0$ and $-1 < z < 1$ of Subsection 1.1. The joint asymptotics in the soft momentum-transfer limit are defined for the combined transition kernel, not for an individual function R_s .

For the chosen crossed partition, set $q = q_+$ at $\varsigma = +1$ and $q = q_-$ at $\varsigma = -1$, where the momentum transfers are defined in (497). The limit is specified by the conditions $q \rightarrow 0^+$, $r = 1 + \mu q$, and $z = \varsigma(1 + r^2 - q^2)/(2r)$. The parameter $\mu \in [-1, 1]$, the scale $k > 0$, the chosen external fields, and the finite time interval $0 < \eta_i < \eta_f$ are held fixed. Hence $x_i = k\eta_i$ and $x_f = k\eta_f$ are also fixed. In this limit, $k' = kr \rightarrow k$ and $z \rightarrow \varsigma$. The values $|\mu| = 1$ are understood as boundary values approached from $-1 < z < 1$. For the momentum transfer q_+ , this is the setup preceding Eq. (195) of the main article, where the catalogue partition 02|13 is denoted by 13|24.

Before taking the limit, the contact contribution with coefficients $b_p, u_p^{(\pm)}, v_p^{(\pm)}$ and the scalar and tensor exchange contributions for both time orderings are calculated using Eq. (192) of the main article. They are added to all five boundary corrections in Eq. (199) of the main article. The explicit corrections for each time-ordered partition are given in Eqs. (385)–(387) of the main article. The reverse time ordering is added separately. The resulting expression is $\tilde{\mathcal{F}}_{\neq 0}$ in Eq. (395) of the main article. In the boundary transformation, the upper limit Q_* of the dimensionful soft band is held fixed with $2Q_* < k, k'$. Its lower limit ϵ serves as a soft regulator: the contributions are first summed at $\epsilon > 0$, and the regulator is then removed in their sum. The contact terms $u_p^{(0)}, v_p^{(0)}$ and the exactly homogeneous exchange are retained separately with the normalization (403) of the main article and are not determined by the $q \rightarrow 0$ limit of the nonzero-transfer contributions.
